

16th International Conference on Wind Engineering

Ruihong Xie\*, Lin Zhao, Shuyang Cao, Yaojun Ge

# Aerodynamic characteristics of a streamlined box girder under velocity shear flow with turbulence

College of Civil Engineering, Tongji University

2023/08/28

**1. Background**

**2. Experimental design and numerical simulation**

**3. Pressure distribution and aerodynamic forces**

**4. Aerodynamic spectrum and vortex shedding**

**5. Conclusions**

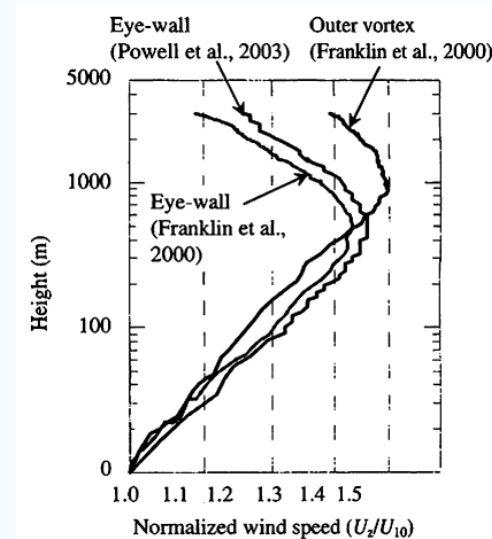

State Key Lab of Disaster Reduction in Civil Engineering

**Background**

**1**

# Characteristics of non-synoptic wind

- ❖ Strong turbulence and large velocity shear rate

Maemi typhoon  
Y. Tamura. 2013

## Typhoon

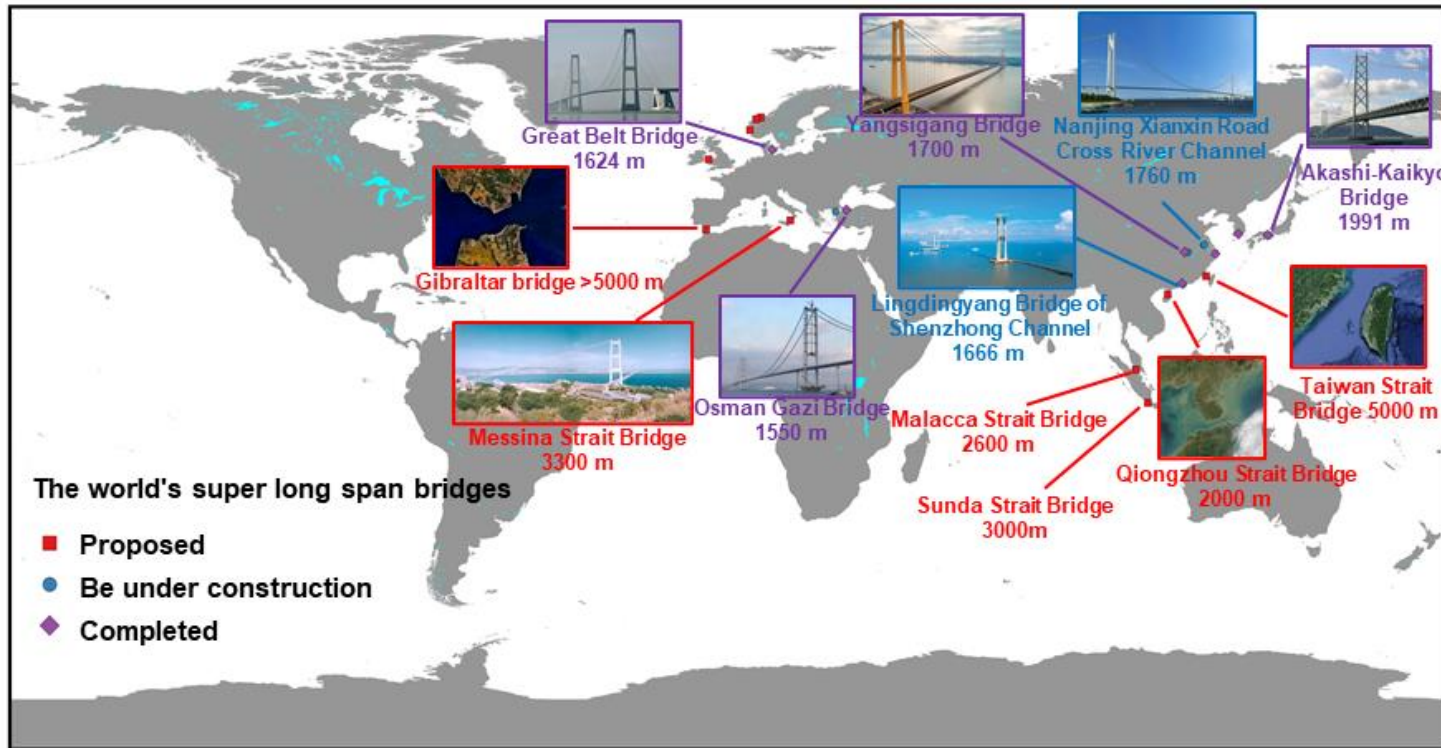

## Downburst

# Long-span bridge structures under non-synoptic wind

❖ Increasing span and frequent non-synoptic wind

Distribution of worldwide long span bridges

Number of typhoons generated annually

Typhoon landings per year

# Structural aerodynamic characteristics

## ❖ Bluff structure under shear flow

**Experimental design and numerical simulation**

**2**

# Experimental design

## ❖ Velocity shear and turbulence simulation

Inlet section

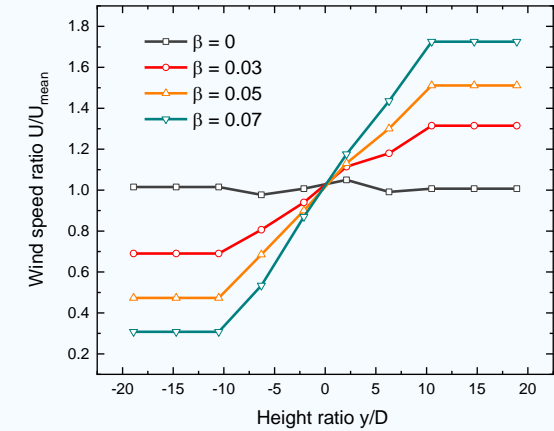

Streamlined box girder

Shear flow over streamlined box girder

$$\beta = G \times \frac{H}{U_{mean}} = \left( \frac{dU}{dy} \right) \times \left( \frac{H}{U_{mean}} \right)$$

Velocity shear simulation

Turbulence simulation

**TJ-5 wind tunnel for velocity shear and turbulence simulation**

## ❖ Uncertainty analysis

$$\varepsilon_u = \sigma_u / \sqrt{N}$$

$$= \frac{\varepsilon_{rms}(u)}{\sqrt{2(N-1)}}$$

Velocity shear

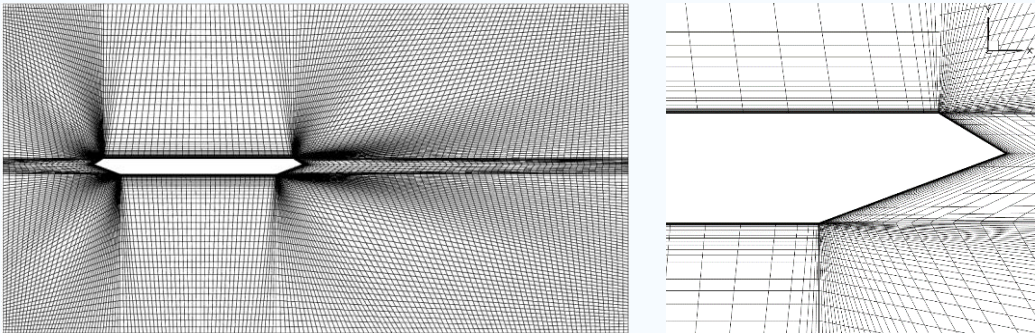

Pressure distribution

Aerodynamic force

## ❖ LES method and model

Computational domain and boundary

Structural grid

$$Re = \frac{U_{mean}B}{\nu} = 2.6 \times 10^5$$

$$L_1 = 12.5D \quad H = 21D$$

$$L_2 = 27.5D \quad L = 2.94B$$

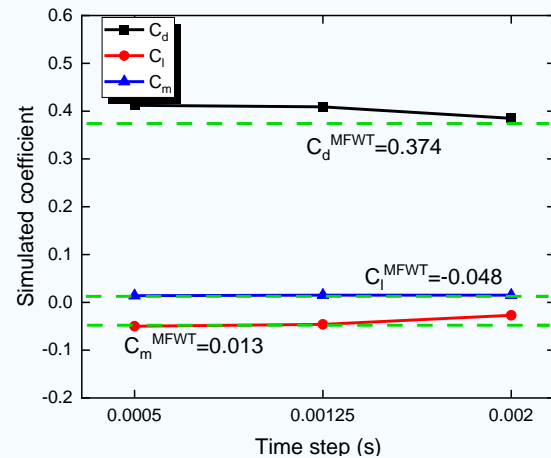

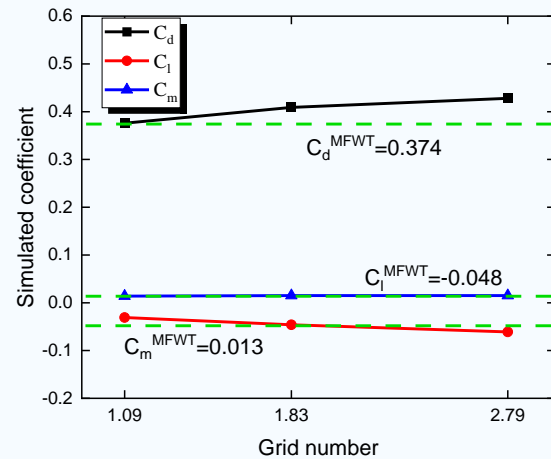

Boundary size

$$\Delta x^+ = 42 \quad y^+ = 0.3$$

$$\Delta z^+ = 12 \quad \Delta d/D < 0.1/\sqrt{Re}$$

Mesh resolution

## ❖ Validation of LES method

Grid and time step independence

Mean pressure distribution

Fluctuating pressure distribution

**Pressure distribution and aerodynamic forces**

**3**

## ❖ Pressure distribution under shear flow without oncoming turbulence

### Shear flow without oncoming turbulence

### Measured taps around box girder

### Pressure distribution

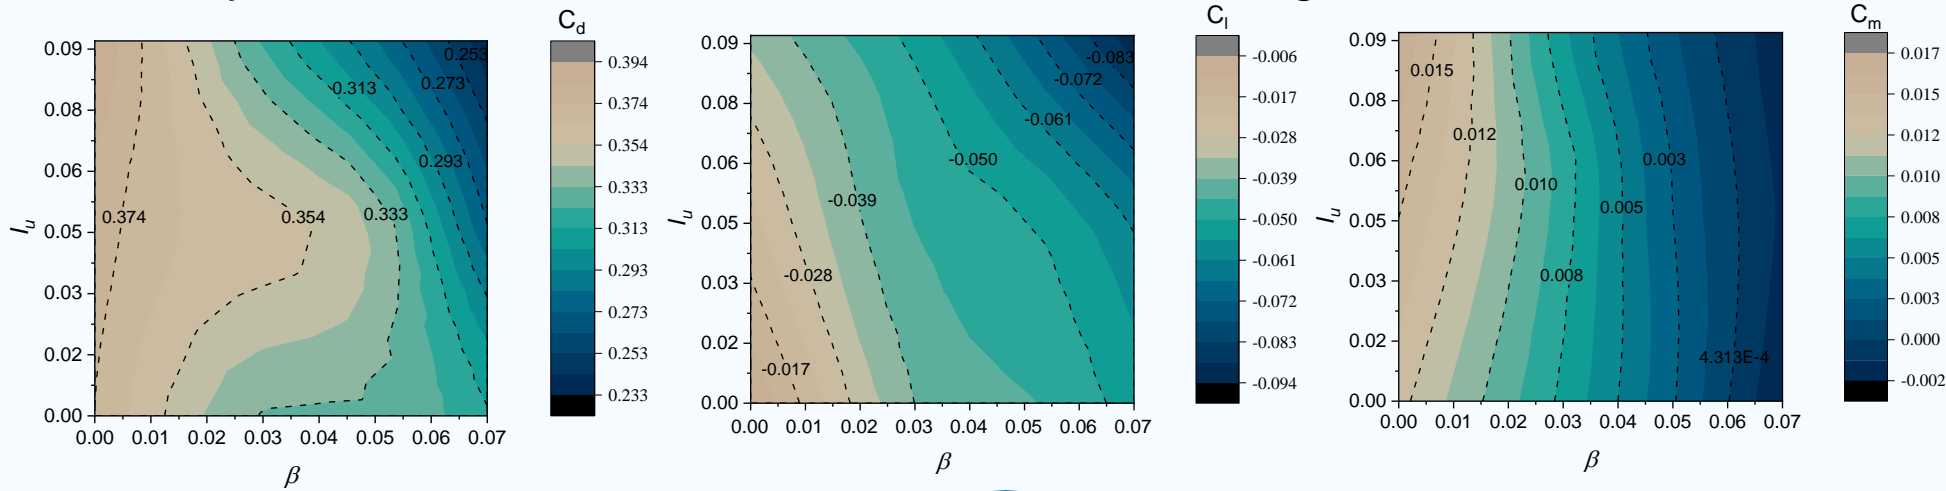

## ❖ Pressure distribution under shear flow with oncoming turbulence

Pressure distribution influenced by velocity shear and turbulence intensity

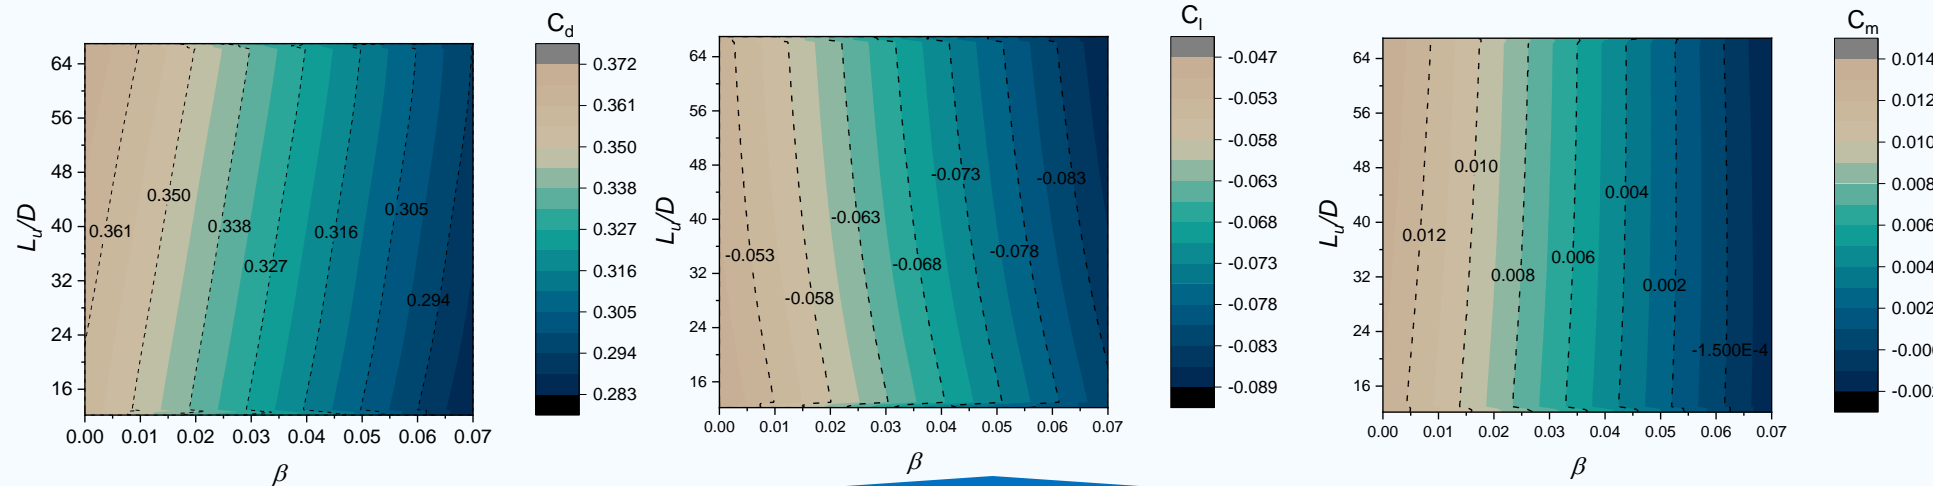

Pressure distribution influenced by velocity shear and turbulence integral scale

## ❖ Aerodynamic forces under shear flow with oncoming turbulence

- Strongly nonlinear drag force
- Lift force increased with shear rate and turbulence intensity

## Aerodynamic forces influenced by velocity shear and turbulence intensity

- Moment force decreased with shear parameter
- Weak influence of integral scale on aerodynamic forces

## Aerodynamic forces influenced by velocity shear and turbulence integral scale

## ❖ Empirical relationship

$$\begin{cases} C_d = \alpha_0 + \alpha_1\beta + \alpha_2I_u + \alpha_3\beta I_u + \alpha_4I_u \left(\frac{L_u}{D}\right) + \alpha_5I_u^2 + \alpha_6\left(\frac{L_u}{D}\right)^2 + \alpha_7\beta I_u^2 \\ C_l \text{ (or) } C_m = \alpha_0 + \alpha_1\beta + \alpha_2\left(\frac{L_u}{D}\right) + \alpha_3I_u^2 \end{cases}$$

Fitted parameter	$C_d$ ( $R^2 = 0.9621$ )	$C_l$ ( $R^2 = 0.9750$ )	$C_m$ ( $R^2 = 0.9840$ )
$\alpha_0$	(0.2212 ± 0.0478)	(-0.0294 ± 0.0054)	(0.0210 ± 0.0013)
$\alpha_1$	(3.3085 ± 1.0019)	<b>(-1.1887 ± 0.1378)</b>	<b>(-0.2312 ± 0.0263)</b>
$\alpha_2$	(7.2230 ± 1.8905)	(-0.002 ± 0.0002)	(-1.41E-05 ± 3.48E-05)
$\alpha_3$	<b>(-67.0307 ± 30.0376)</b>	<b>(-2.0069 ± 0.5199)</b>	<b>(-0.1394 ± 0.0642)</b>
$\alpha_4$	(0.0360 ± 0.0168)	--	--
$\alpha_5$	<b>(-77.5930 ± 17.0623)</b>	--	--
$\alpha_6$	(-2.51E-05 ± 1.59E-05)	--	--
$\alpha_7$	<b>(830.8719 ± 227.2152)</b>	--	--

- Drag force dominantly affected by  $\beta I_u$ ,  $I_u^2$ , and  $\beta I_u^2$  term
- Lift force dominantly affected by  $\beta$  and  $I_u^2$  term
- Dominant terms of moment force are similar to lift force

# Aerodynamic spectrum and vortex shedding

4

## ❖ Aerodynamic spectrum under different shear parameters

**Drag coefficient**

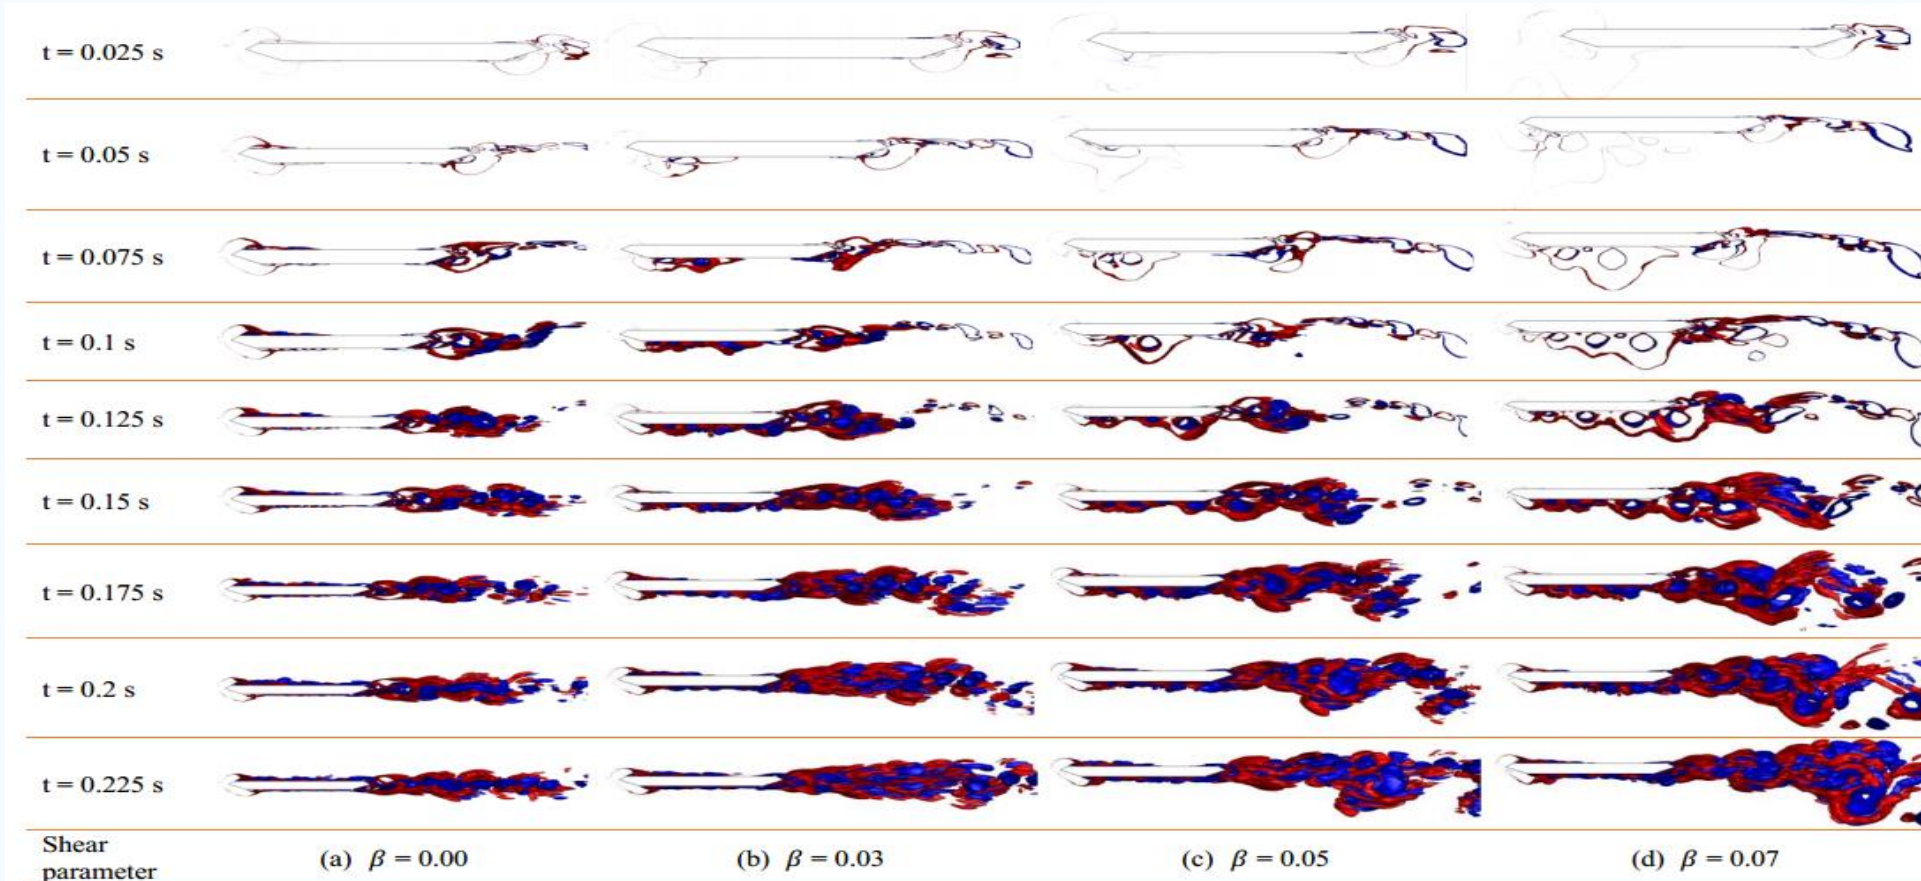

**Lift coefficient**

**Moment coefficient**

- Weak influence of velocity shear on dominant frequency
- Large shear parameter results in increased amplitude of aerodynamic forces at high-frequency band

## ❖ Instantaneous dynamic wake under initial period

- Velocity shear suppresses the generation of vortex structures at high-speed side , and the suppression effect increases with the increase in shear parameters
- Vortices always generate, develop, and detach from the low-speed side to the downstream side in velocity shear flow

## ❖ Three-dimensional instantaneous dynamic wake vortex under shear flow

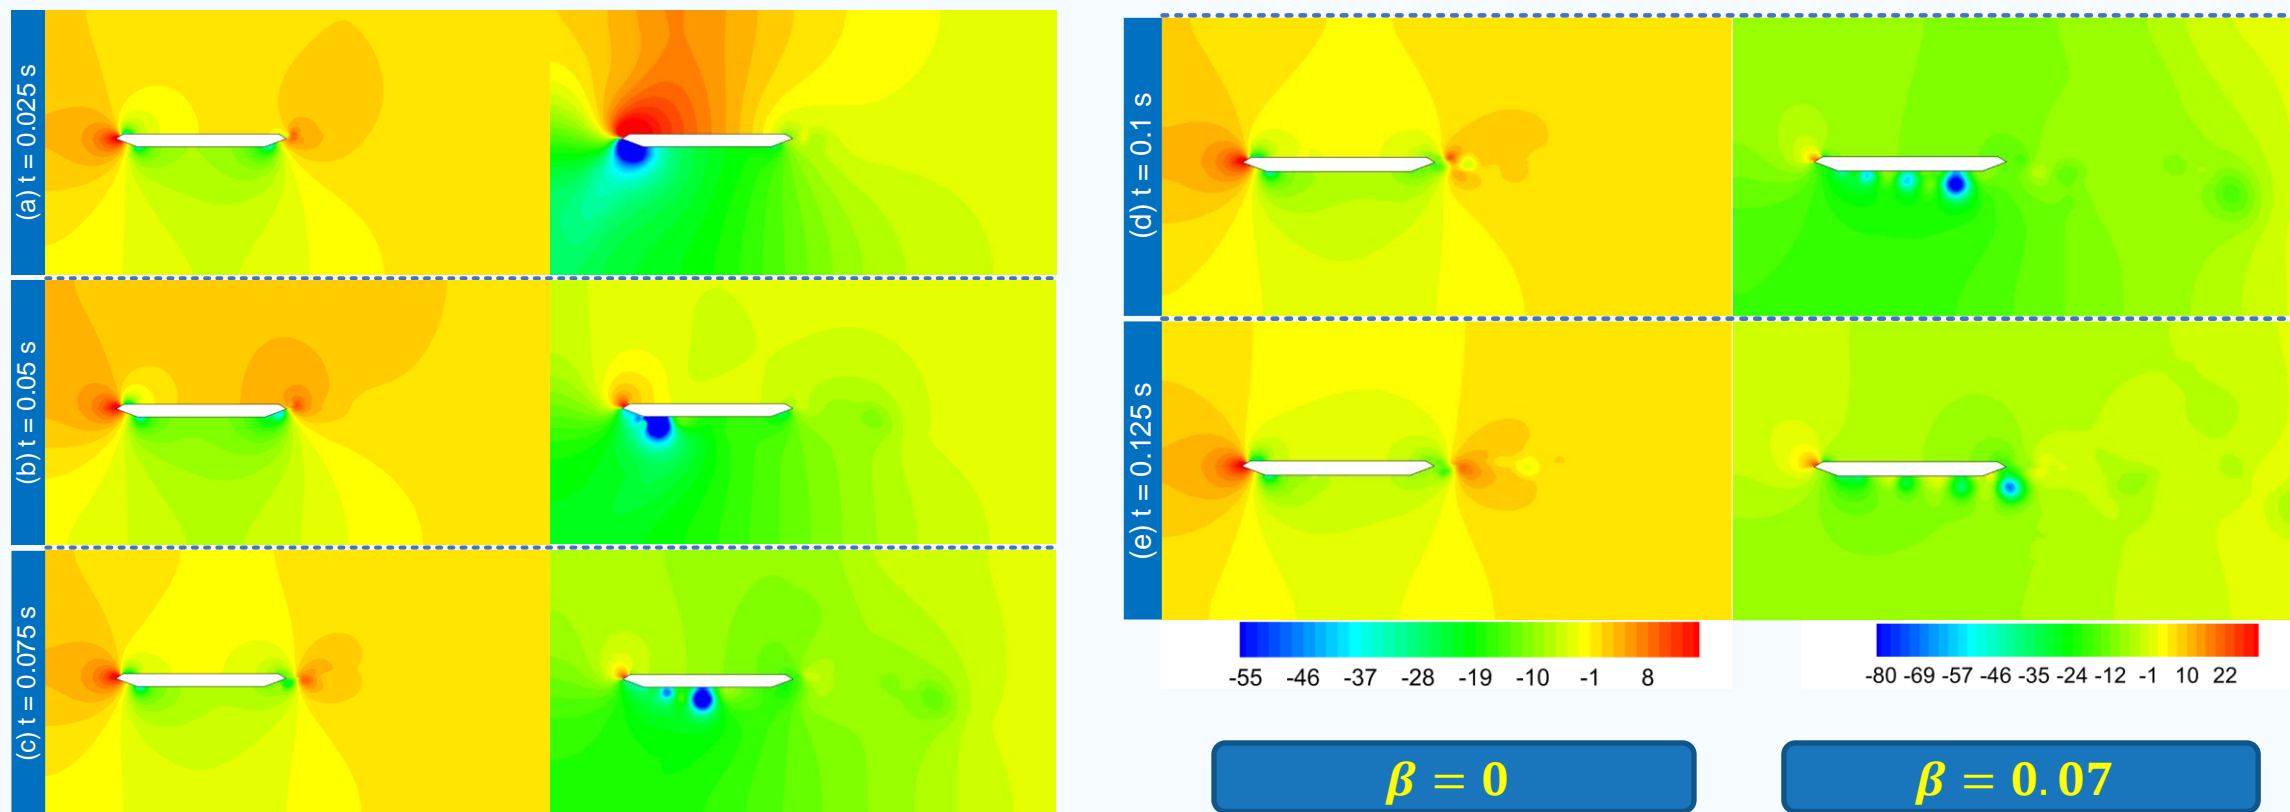

### Instantaneous vortex on the high-speed side ( $t=0.225s$ )

- Counterclockwise (red) vortex dominates on the windward side, corresponding to the positive pressure measured in MFWT
- The vortex on the high-speed side of the box girder is suppressed, forming a "vacuum" zone by double vortex isolation
- The low-speed side vortex of the box girder changes from alternating regular Karman vortices to fragmented irregular vortex structures with increasing shear parameters

### Instantaneous vortex on the low-speed side ( $t=0.225s$ )

## ❖ Instantaneous pressure distribution in uniform flow and velocity shear flow

- The pressure distribution in uniform flow field is relatively stable
- Instantaneous local extreme negative pressure occurs in the velocity shear flow due to the generation and drift of vortex on the low-speed side

## Conclusions

# 5

- The **fluctuating pressure** significantly increases with the increase in shear parameters, indicating that the velocity shear flow is self accompanied by **turbulence effect**
- The **turbulence intensity** only increases the mean pressure of the streamlined box girder when the shear parameters are high; the **turbulence integral scale** has almost no contribution to the pressure distribution
- The turbulence intensity exhibits **strong nonlinearity** in the drag force of the box girder; the integration scale has a **weak influence** on the aerodynamic forces
- The velocity shear **suppresses** the generation of vortex structures of the high-speed side, and the vortex structures always first generate and develop from the low-speed side

# Thanks!
